

How did COVID affect the gas supply chain?

Our project discusses how the COVID-19 pandemic affected the supply chain in general and specifically its impact on gas. We will present on these specific topics: demand for gas, foreign trade of gas, and how inflation impacted gas prices. We will discuss what the situation looked like before, during, and after the pandemic, as it forced changes at all levels of the economy. As consumers of goods and services we feel the impacts of supply chain disruptions and it is important to understand why they happen and what the various consequences may be so we can be better prepared.
